

Post Implementation Evaluation Report

FHSU z/890 Purchase – Fort Hays State University

Project Dates: 4/2006 through 9/2006

Project Cost: \$677,657

Project Objectives

In our recently completed Administrative System Project, FHSU converted data to a contemporary relational database. This was needed so that programmers would have contemporary tools available to create web-based, portal access to administrative information. The technical objectives for this project was to have a good response time for the CICS transactional and batch programs as well as good response time for the web applications. The system needed to host VSE, CICS, and UDB to support the application code of our administrative system. The system needed to access and fast response time for web applications written in the .NET (C#) environment. It needed to support stored procedures written in Microfocus Cobol in the Linux environment.
